

# Git Crash Course

Fearlessly develop!

Paul Bitutsky  
Jerry Chen

# Agenda

- Setup pre-reqs
- Why learn Git?
- Essential Git
- GitHub

# What is Git?

Is it just short for GitHub?

- Answer: No
- Git is a version control system. It's a tool used to manage code history. It's like a programming language... it has a syntax
- GitHub is a website for hosting Git repositories
- An alternative to GitHub is Atlassian's Bitbucket, which also hosts Git repos

# Why learn Git?

# Why use version control?

The "real" question

- Many companies (and some courses @ Berkeley!) use a VCS (Version Control System)
- Git is one possible (and popular) tool

# Existing "Version Control"

Many problems!

- Not enough granularity
- *Too much* granularity
- Useless version naming
- Managing many copies of a file

# Git

A bright and beautiful future

- Create "checkpoints" at your **own pace**
- **Custom descriptions** for versions
- Only a single version of a file to **focus** on at a time

Downside: This does take some time to learn...

# Git Essentials

# Vocabulary

- **Repository (Repo)** - a directory of files plus edit history
- **Commit** - a snapshot of the repository state

# Some Non-Git Commands

Basic file manipulation

- `cat` will output contents of a file
- `touch file.txt` creates a empty file
- `echo "TEXT" > file.txt` replaces file with "TEXT"
- `echo "TEXT" >> file.txt` appends "TEXT" to a file

# Let's get started

Please get your computer ready

This part is best if you have a computer to follow along with

If you don't, no worries — you can view the slides & notes later

# Creating a Local Git Repo

- Most of Git is local
- Remote work involves just a few new commands

# Commit Messages

A brief note

- Good commit messages are hard to come by
- Bad commit messages are worse than useless

758575d Merge pull request #26 from Berkeley-CS162/blargh  
606878f some persistence working again  
ba6af4d (**origin/subdirs**) Revert to the "so far" commit  
b887e6d lol  
85320da tons of tests pass  
06e8ee0 grow-tell-persistence seems to pass  
f6aa390 so far  
748f040 Merge branch 'subdirs' of <https://github.com/Berkeley-CS162/group11> into subdirs  
f232868 made some progress on vine  
b549c97 Various fixes (see full commit message for more detail)  
1b4efdd blsggtefd  
8710759 stupid piece of  
971d0ac stuff  
13c2813 Update helper fxn name  
47e930e dir open  
58468d2 Prevent bad access from crashing the program  
402a5ff Deny writes to dirs  
4ae06eb trying to open dirs  
d0f3044 accessing files in subdirs  
ae5cd2b prep for '.' and '..'

f232868 made some progress on vine  
b549c97 Various fixes (see full commit message  
1b4efdd blsggtefd  
8710759 stupid piece of  
971d0ac stuff  
13c2813 Update helper fxn name  
47e930e dir open

1. Short and descriptive
2. Use imperative mood for the subject line
3. Addl. details (if any) go in the body

# Log

History in depth

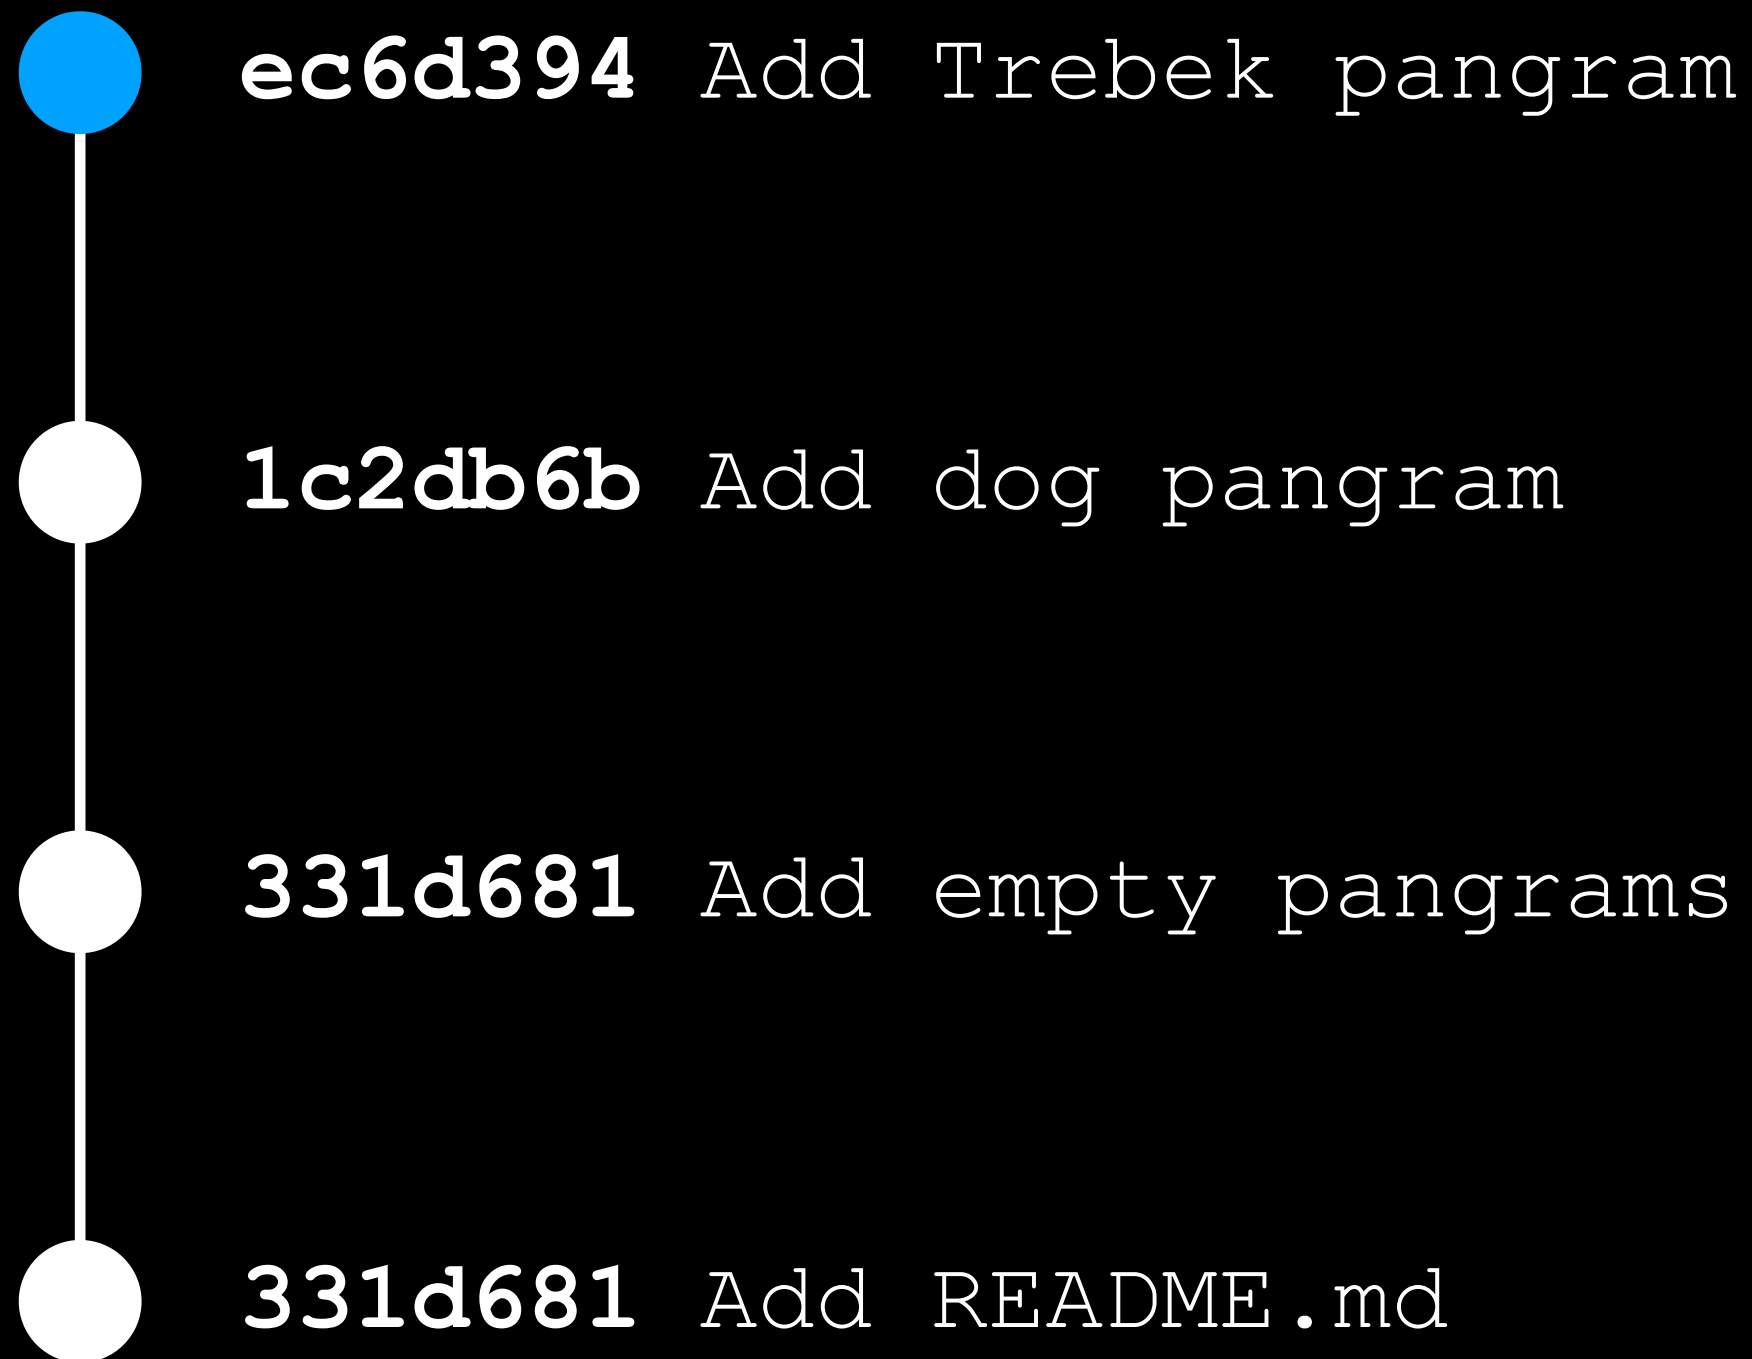

- Let's formalize the concept of the log
- Commits remember their parent

Demo

**ec6d394** Add Trebek pangram

You are here (HEAD)

Beginning of time

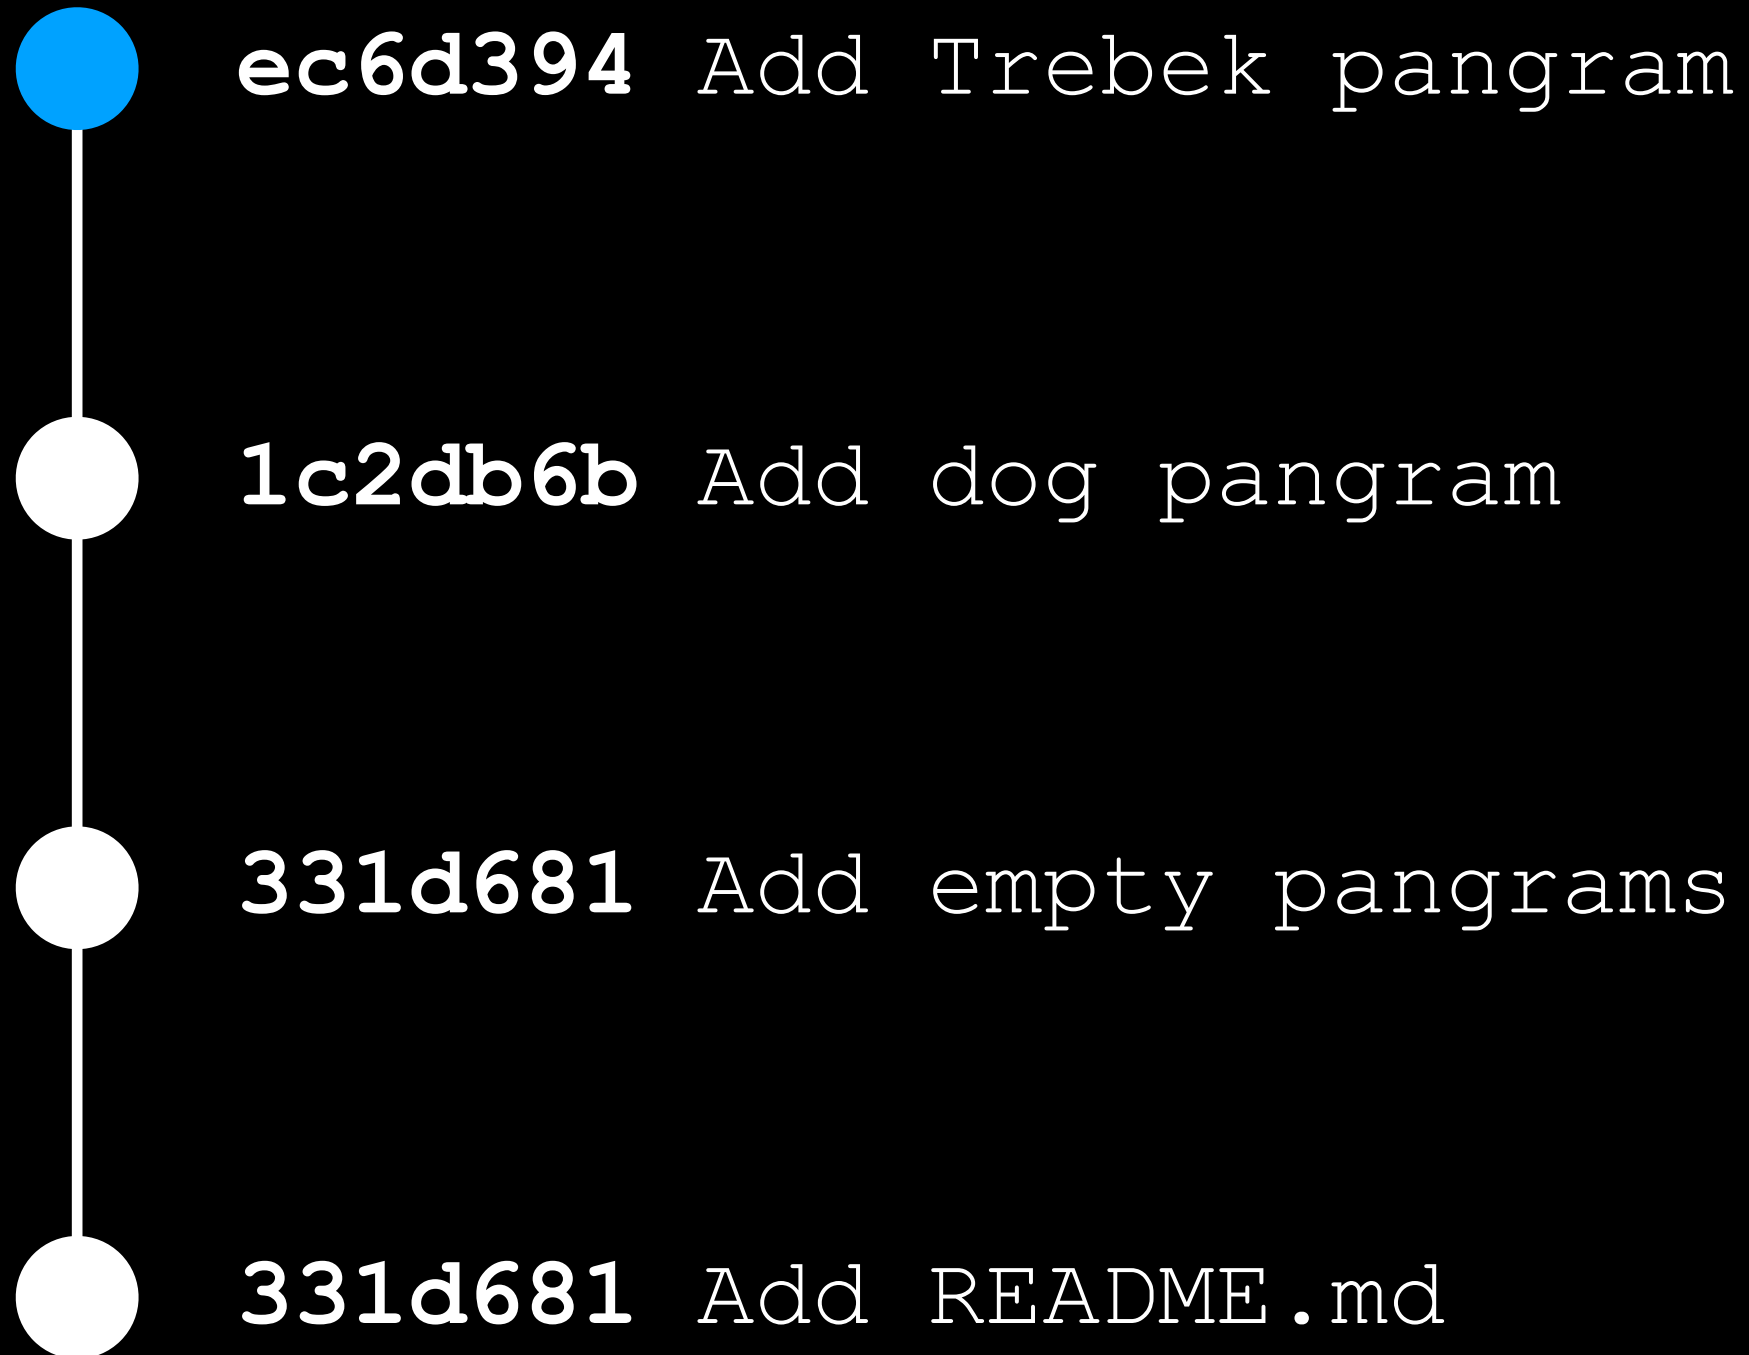

# Branches

An introduction to multiverse theory

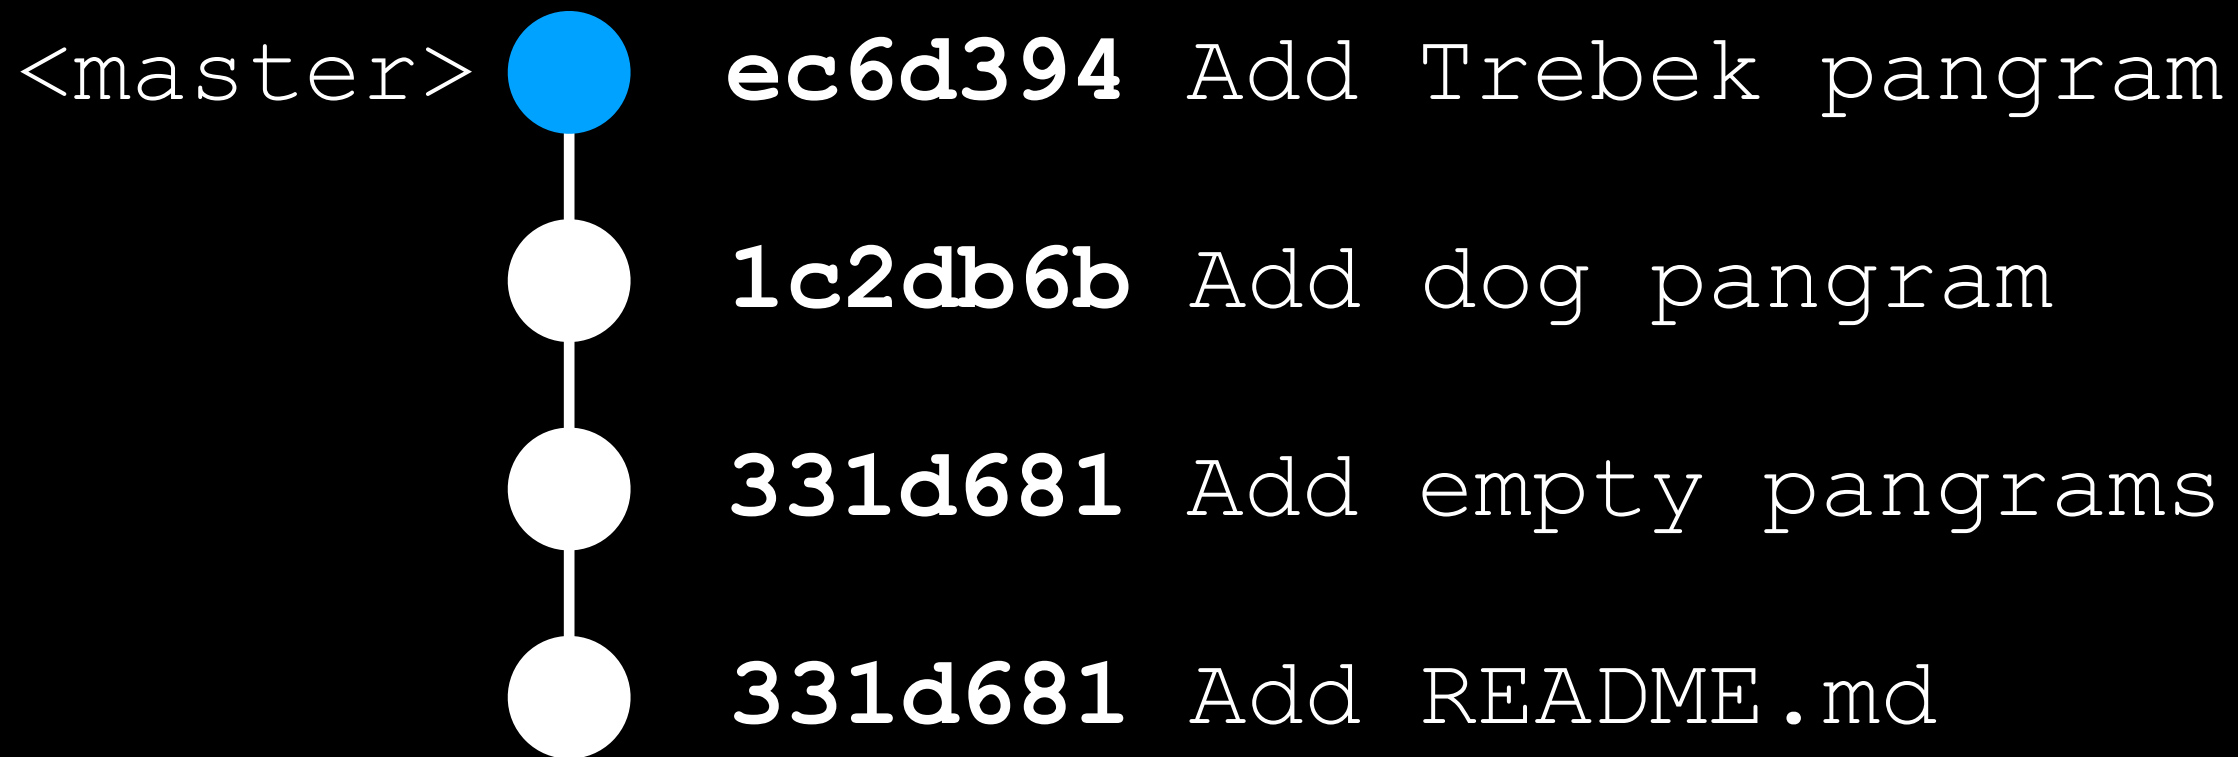

- Branches are labels pointing to specific commits
- "master" is the default starting branch

Demo

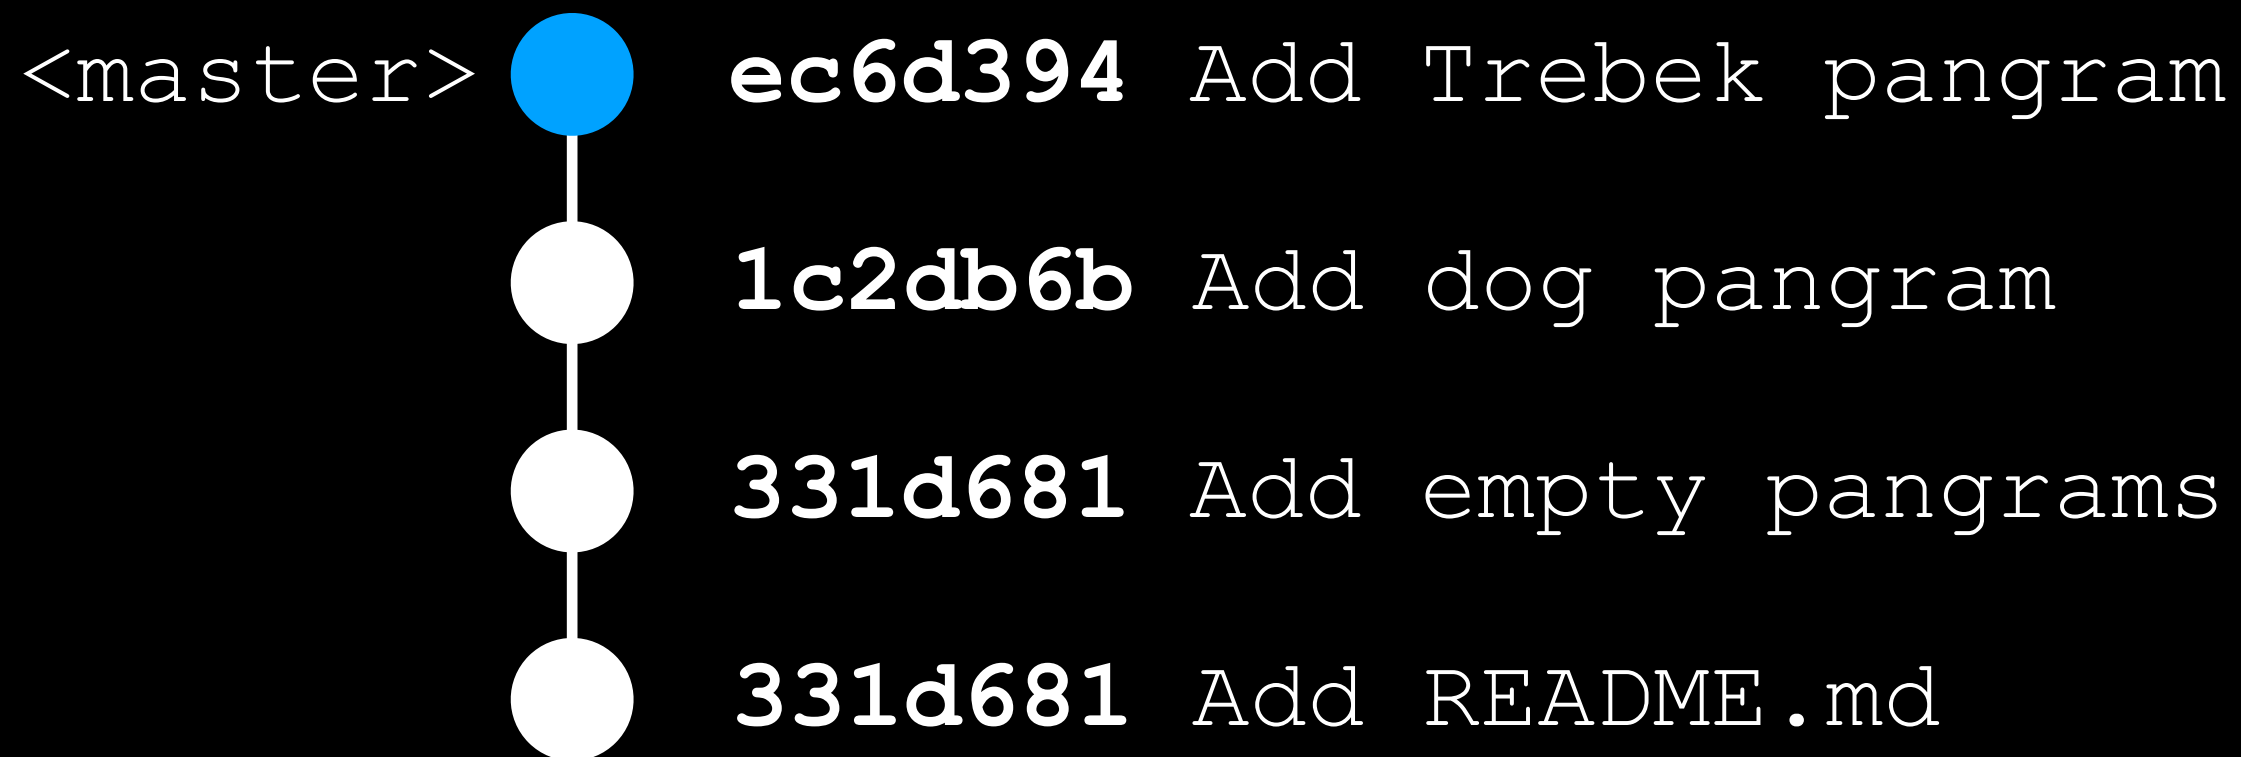

You are here

Beginning of time

HEAD

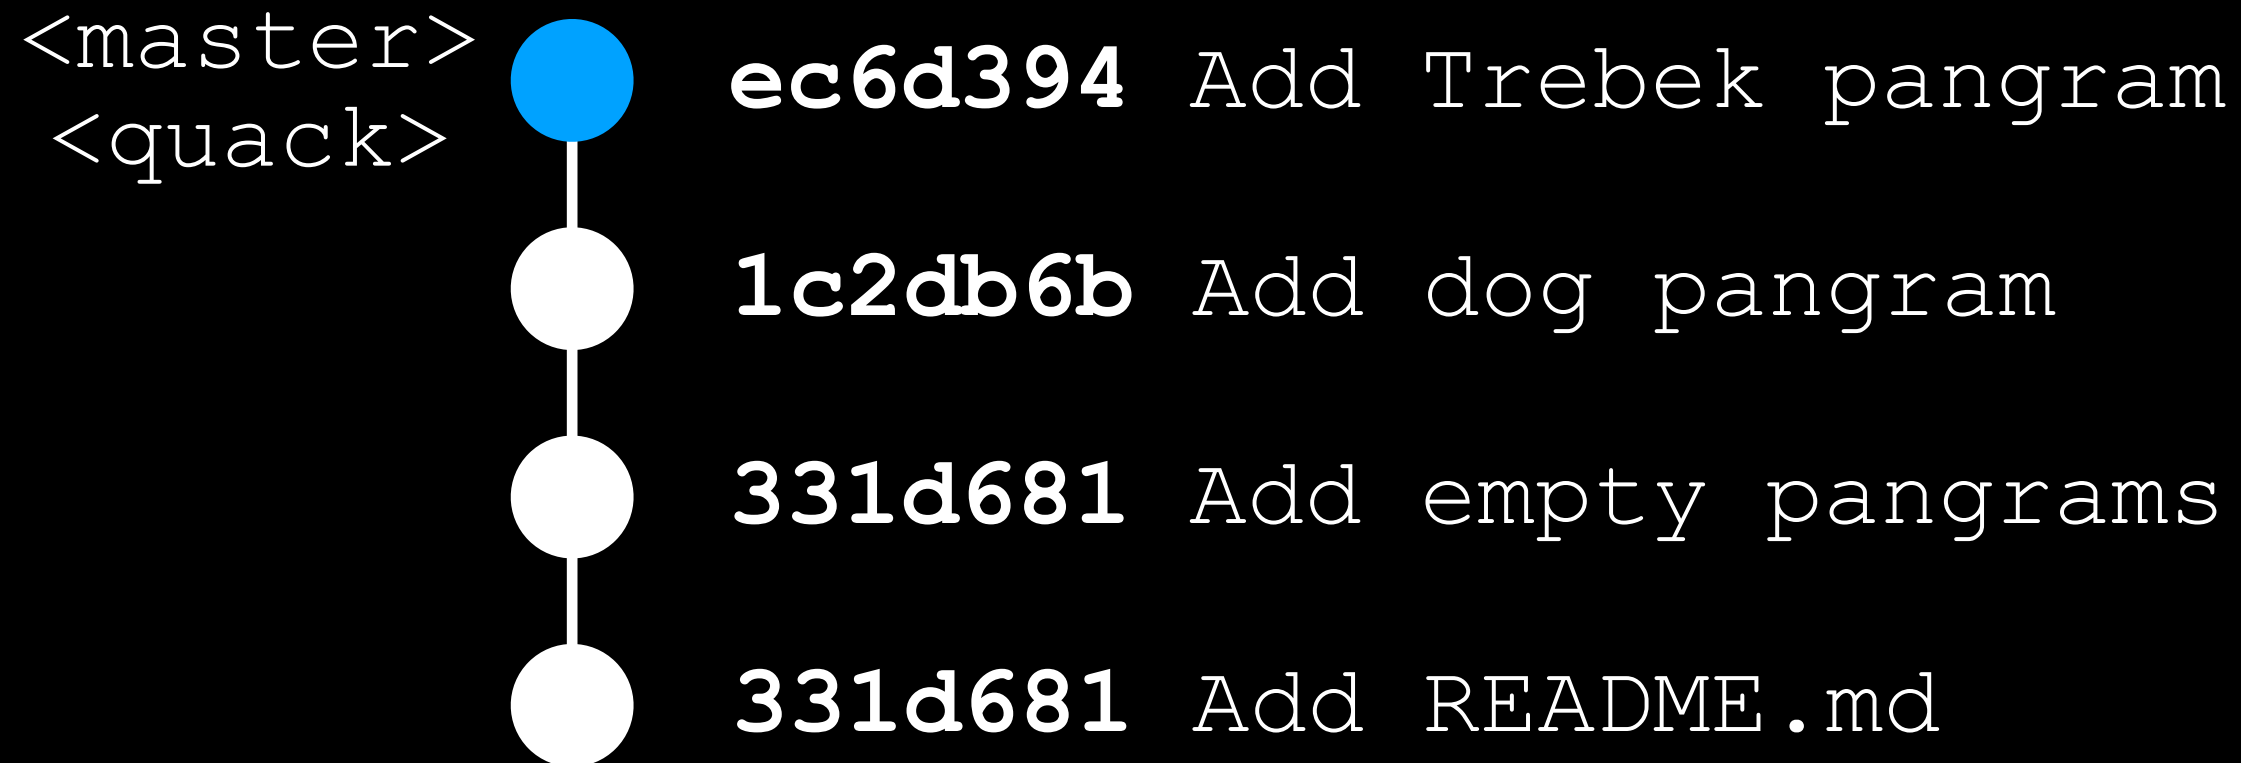

```
git branch quack
```

HEAD

git commit

git commit

```
git checkout quack
```

git commit

git commit

git commit

# Merging

Worlds collide

- Now it's time to combine our work
- Usually this is boring

```
git checkout master
```

```
git checkout master
```

```
git merge quack
```

```
git merge quack
```

<master>

**ff2ee03** Merge branch 'quack'

+fox  
+quack

pangram1.txt

+quack

pangram3.txt

**b676eb2** Add more fox

<quack>

**19bccb7** Quacking

Demo

**Break**

# Restoring

What good is a history if you can't use it?

- This part is dependent on the commits you created earlier
- As before, this works best if you can follow along

# Checkout

One tool, many uses

## Changing position in the commit history

- `git checkout branch_name`
- `git checkout commit_id`

## Changing files only

- `git checkout -- file_name`
- `git checkout commit_id -- file_name`

Demo

HEAD

```
git checkout 1c2db6b
```

git checkout master

HEAD

# Reset

Change branches

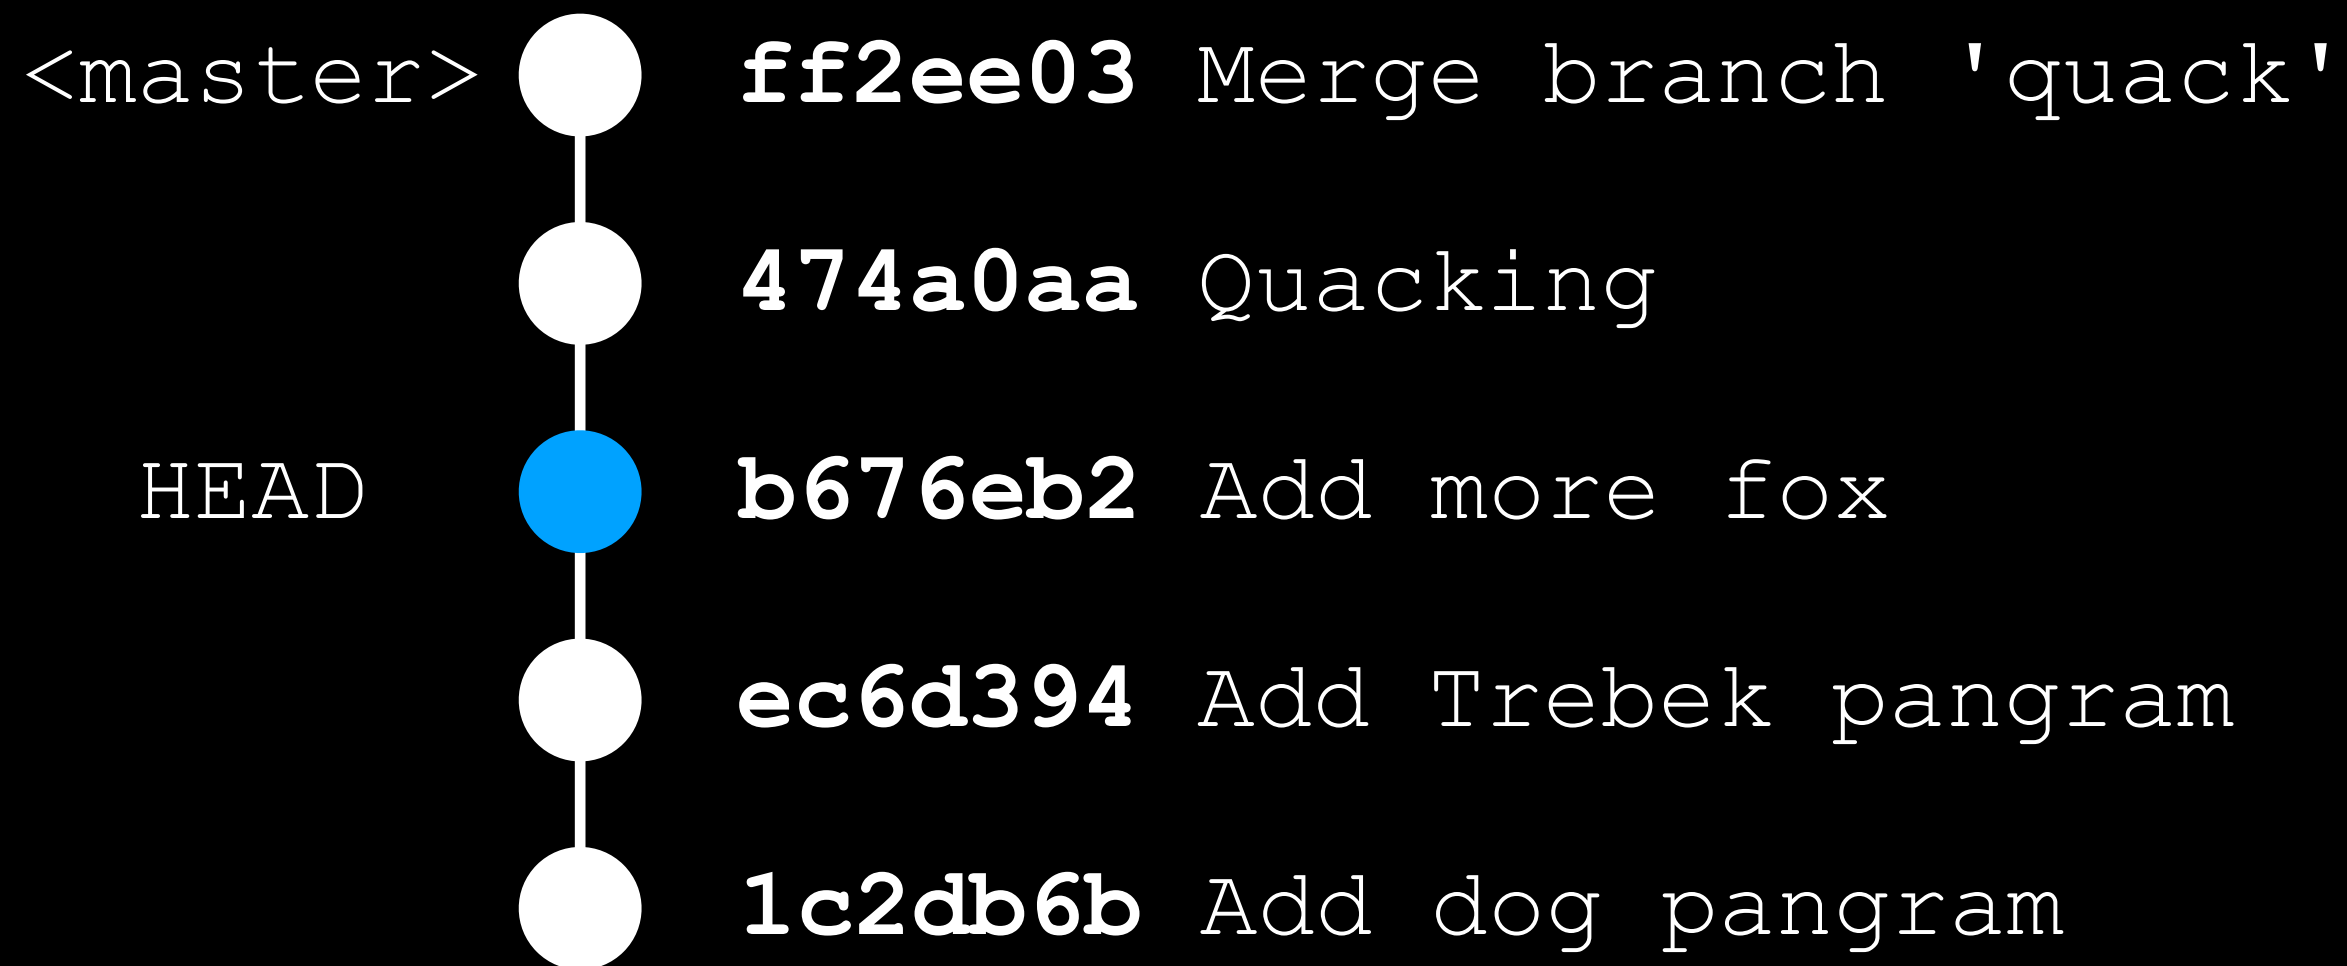

- Update the current head
- Also update the current branch to match (if applicable)

Demo

HEAD

```
git reset b676eb2
```

```
git reset b676eb2
```

HEAD

# Reset vs Checkout

When applied to branches (not files):

- checkout changes the location of HEAD
- reset changes the location of HEAD AND updates branch

# Grab Bag

Three quick and useful tools

- `git diff`
- `git show`
- `git grep`

Demo

# Grab Bag

Relative references

Tilde (~) and caret (^)

- `master~1`
- `HEAD^2`

# HEAD

<master>

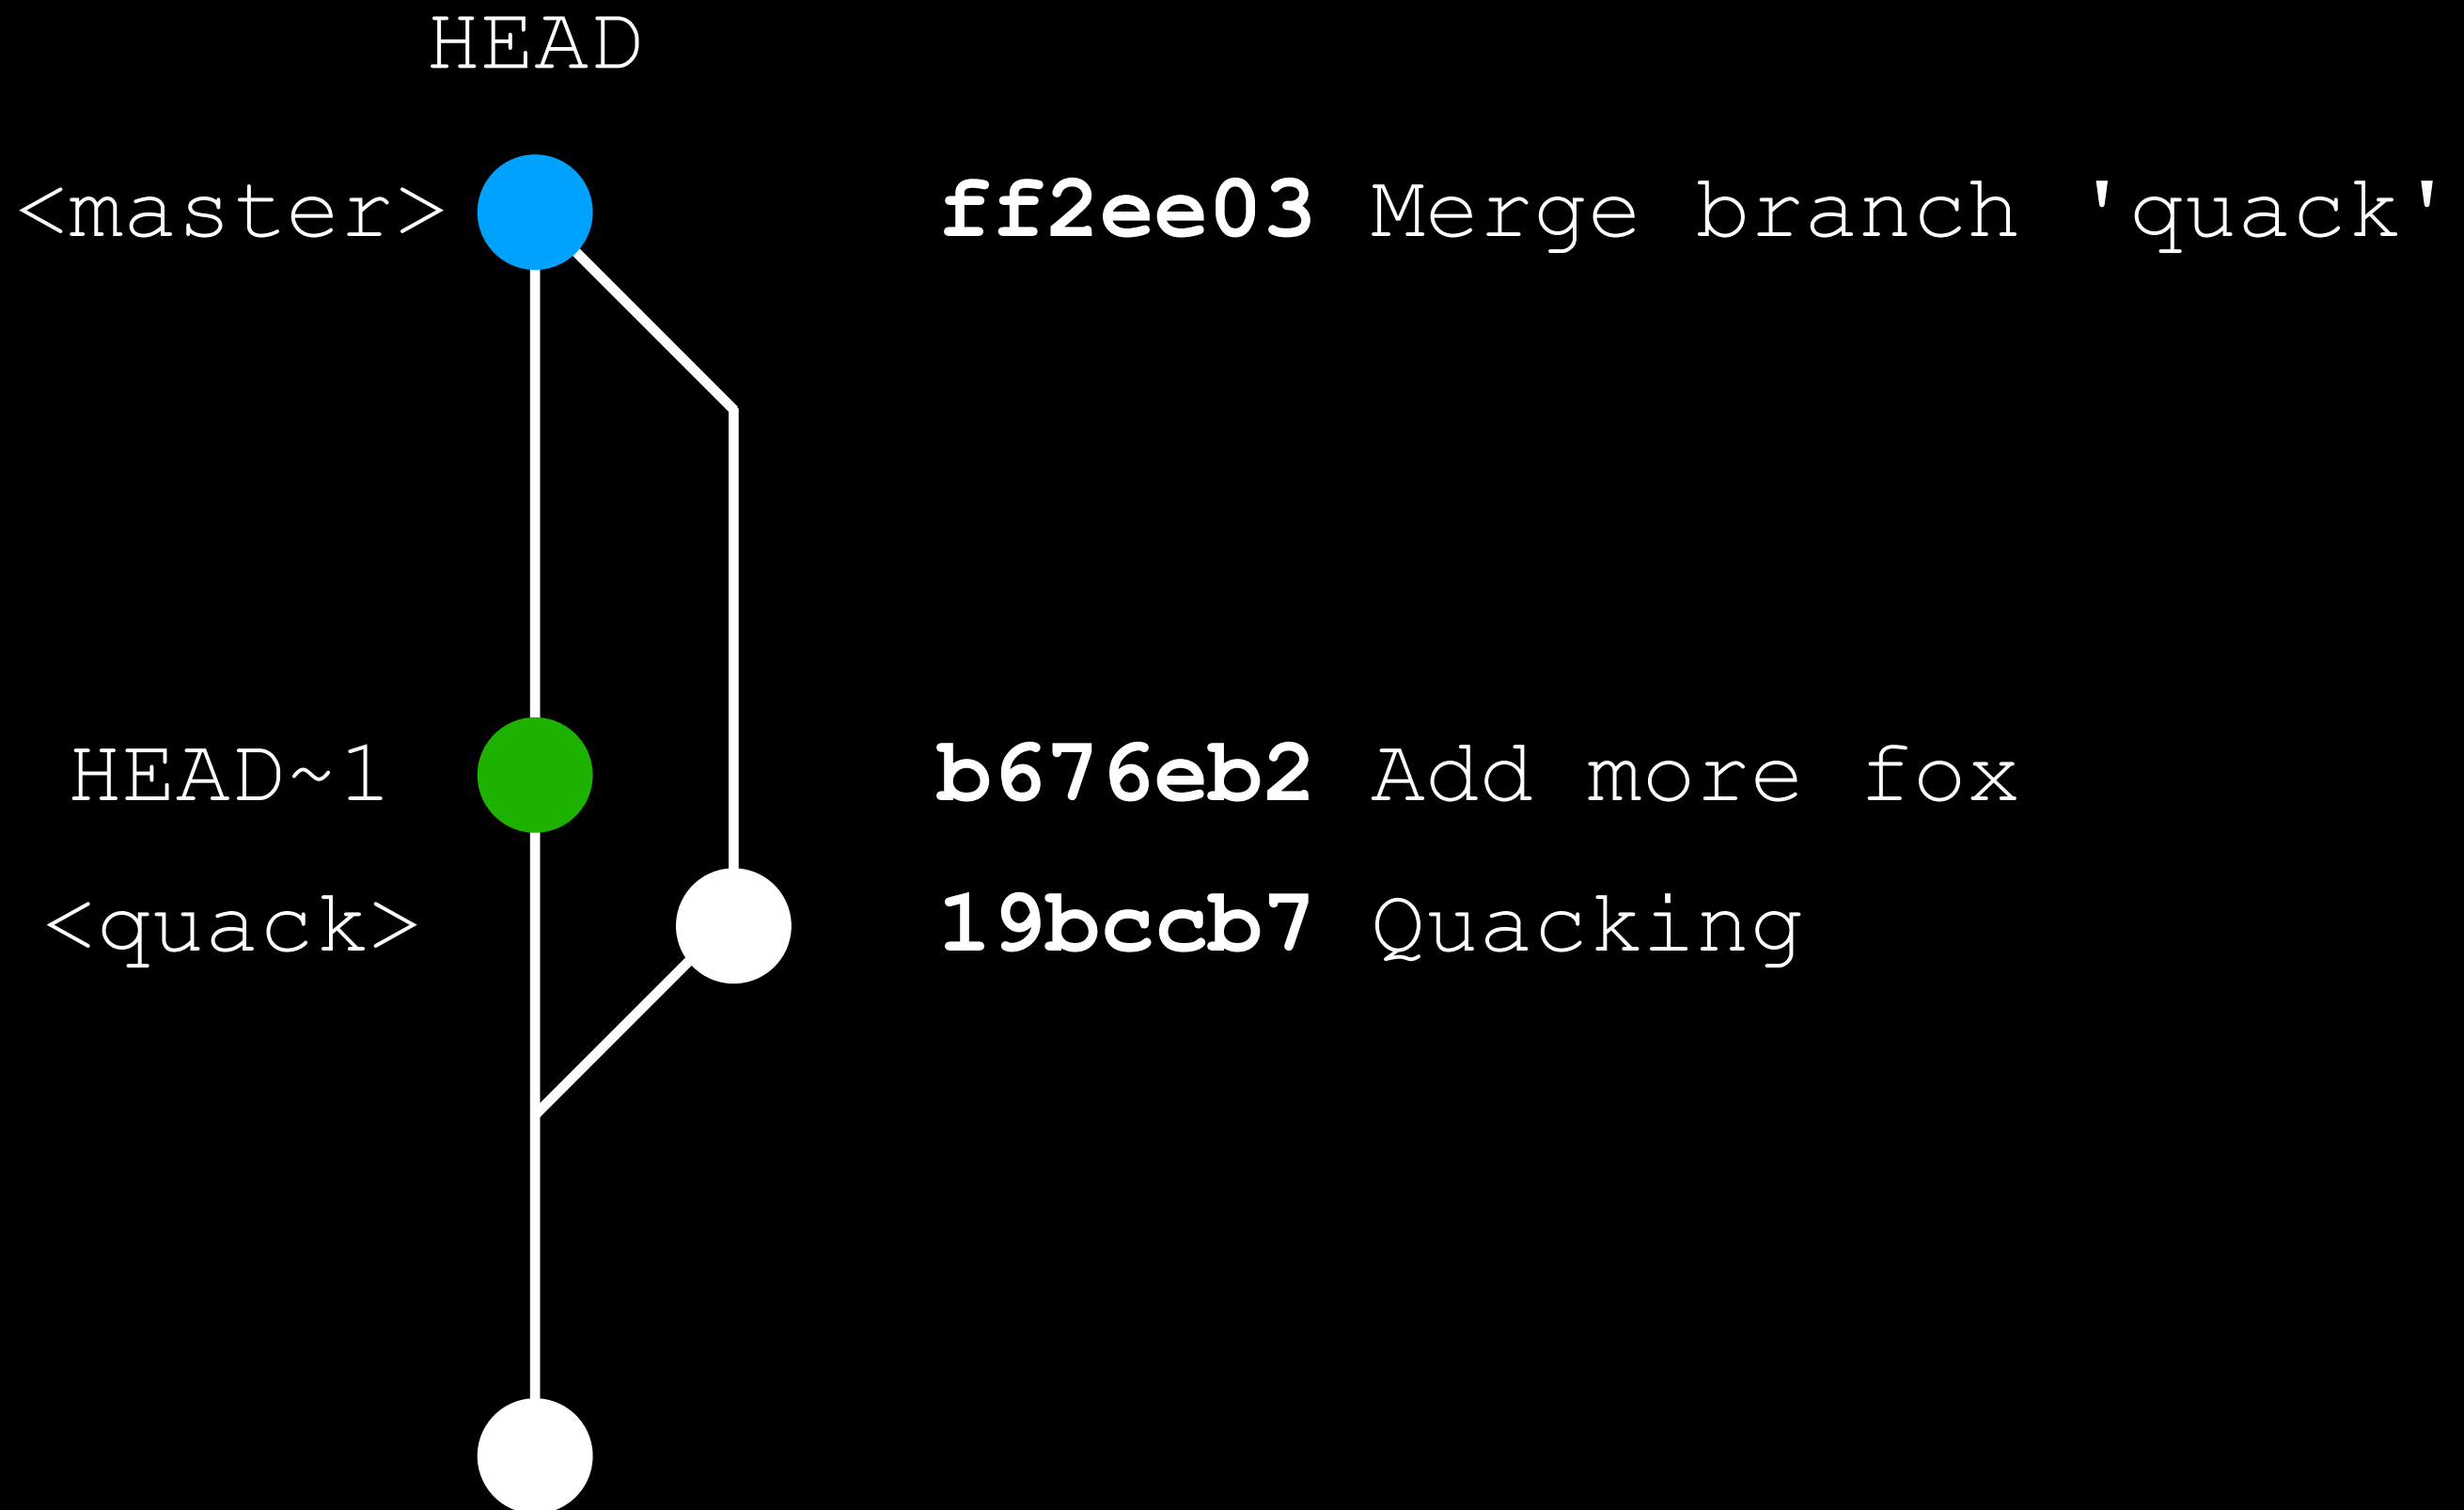

ff2ee03 Merge branch 'quack'

**b676eb2** Add more fox

<quack>

# 19bcb7 Quacking

Demo

# In Summary

- `init`
- `add, commit`
- `log`
- `branch`
- `merge`
- `checkout, reset`
- `diff, show, grep`
- `master~1, HEAD^2`

# Congratulations

You now know enough Git to be dangerous

- Too dangerous actually
- You may want to periodically backup your work using more traditional methods until you're more comfortable

There's a lot more to  
learn

Cherry-pick

Interactive rebase

Rebasing a branch

Clean

Bisect

Creating patches

Reflog

.gitignore

Tag

Revert

Stashing changes

Blame

GitHub

# Let's get started

Please get your computer ready

This part is best if you have a computer to follow along with

If you don't, no worries — you can view the slides later

# The GitHub Model

Two repos, one story

- Local repository on your machine (same as before)
- Update remote repository as desired

# Push and Pull

- Commits will update local repository
- Remote repository missing changes? **Push from local**
- Updated content on remote repository? **Pull from remote**

HEAD

Local

Remote

`<master>`

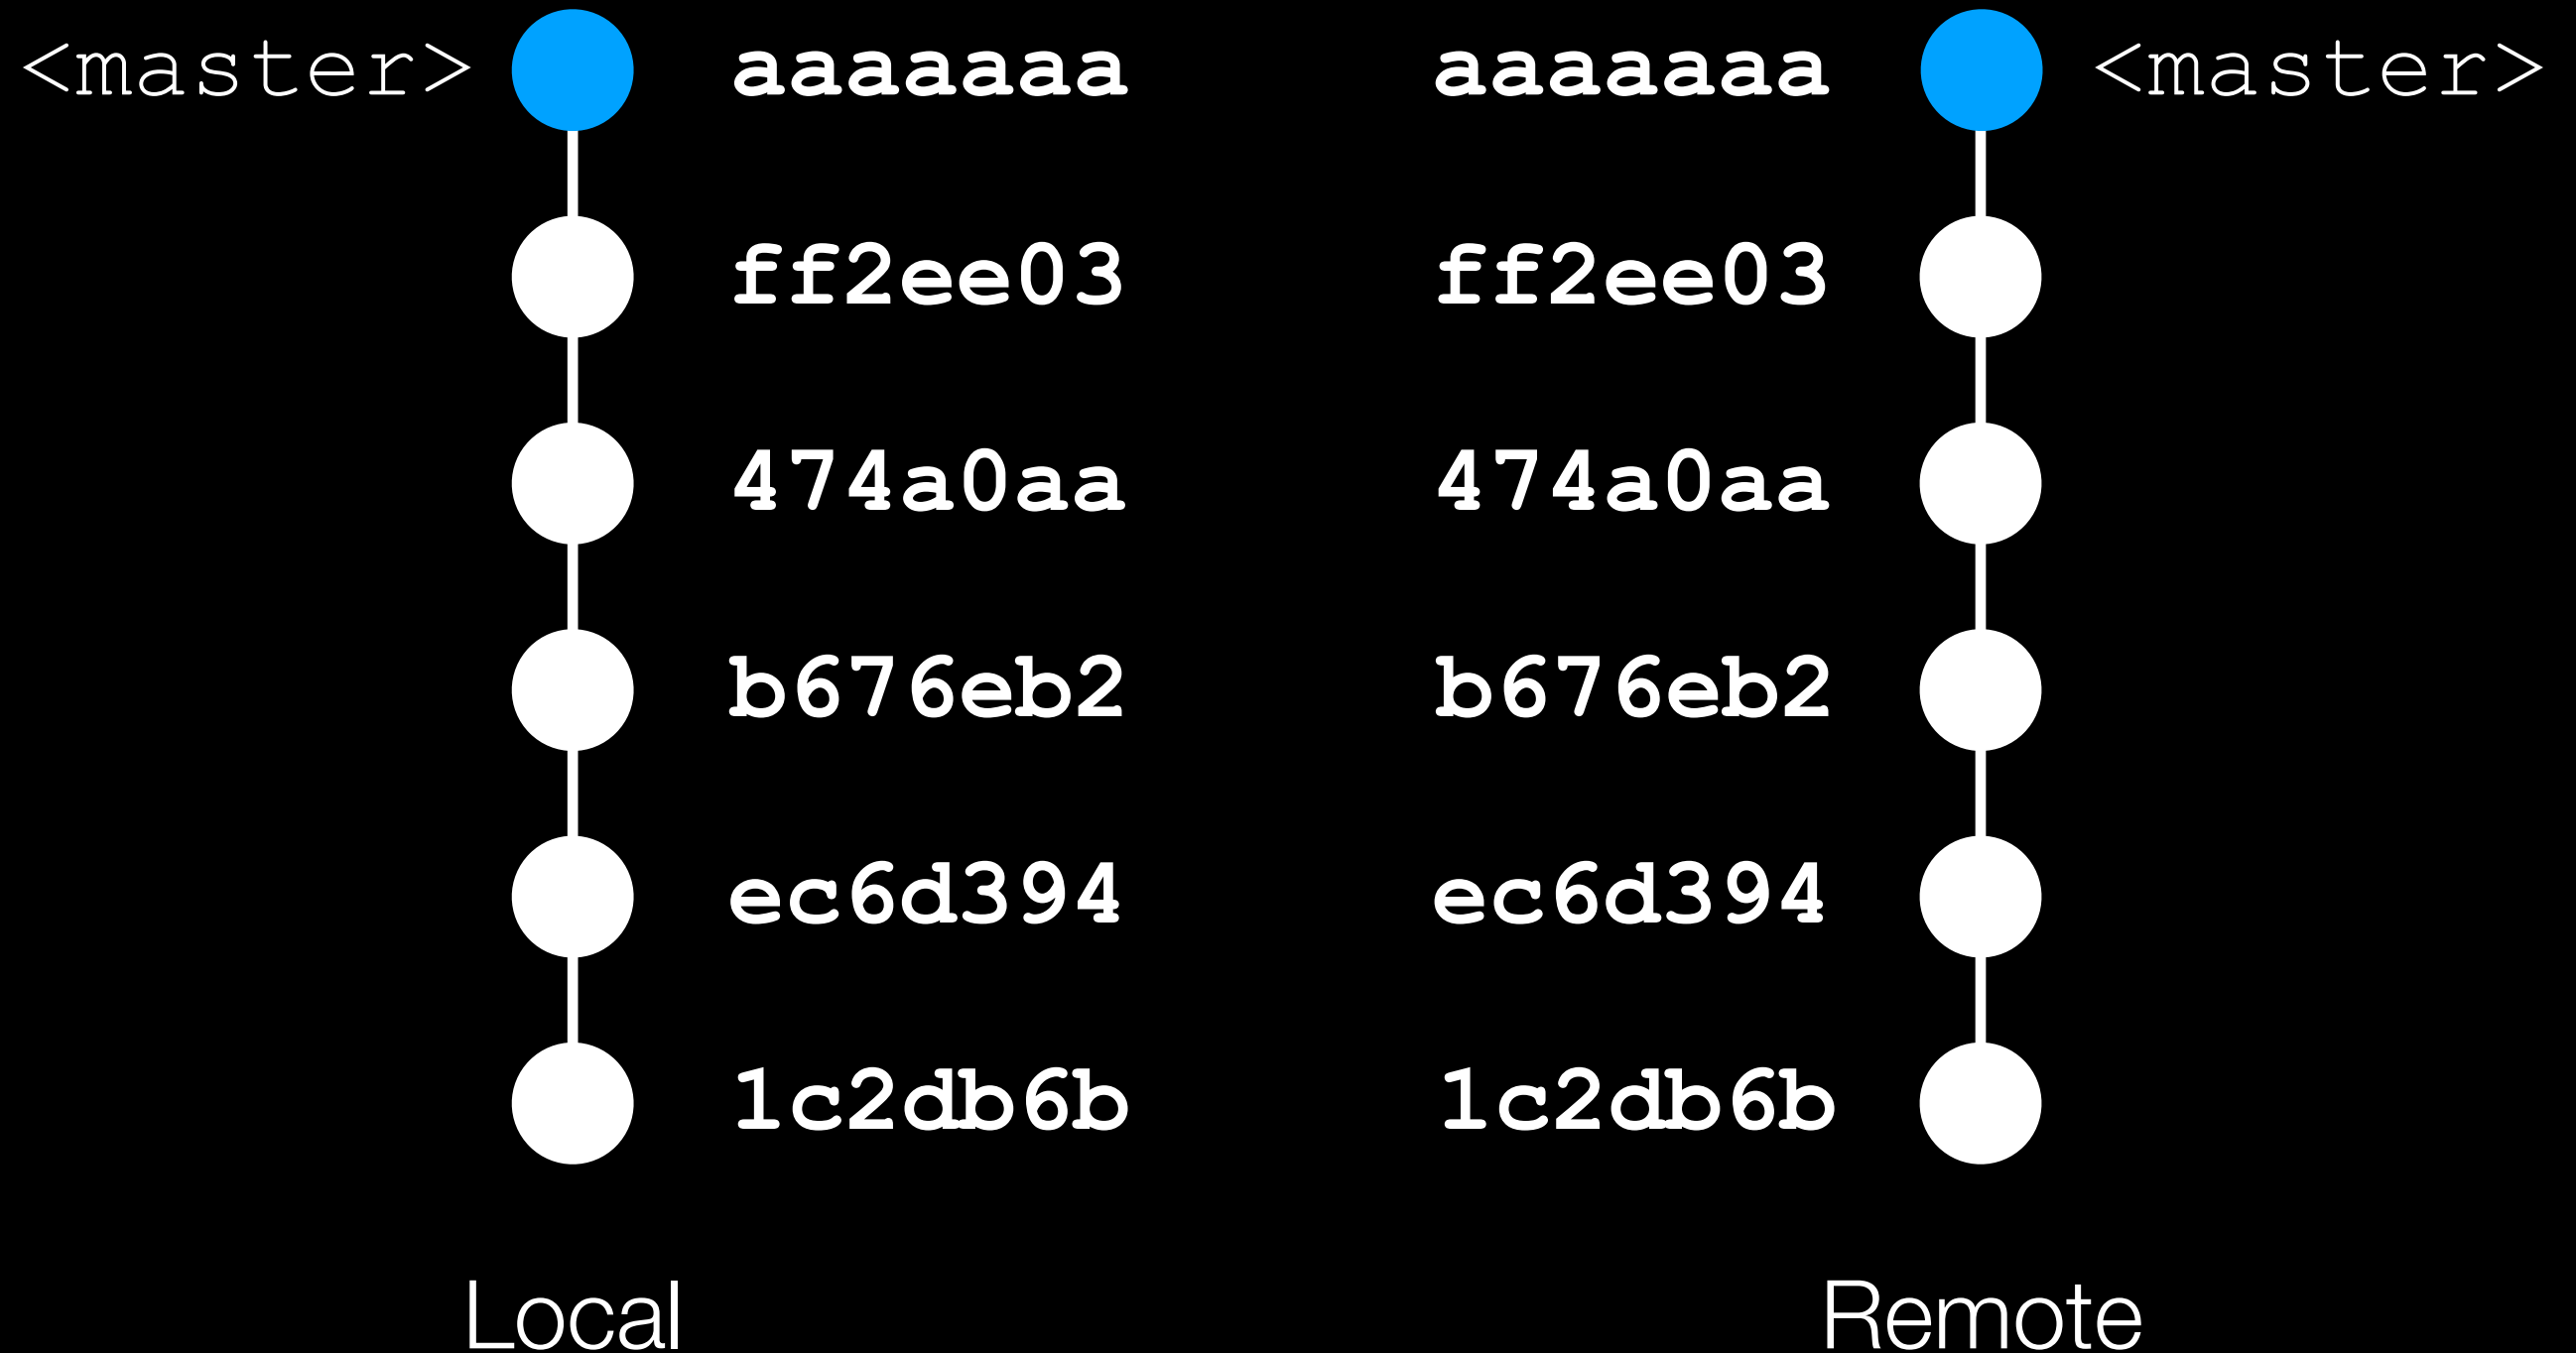

git push origin master

git commit (on another machine)

git pull origin master

Demo

# Putting it all together

Finally, the real world

- Merge conflict example from before
- Now, different people changing the same branch
